

Michael Fossel, MD, PhD

Our world has changed.

Over the past few weeks, our lives have changed unexpectedly and, for most of us, dramatically. The Coronavirus pandemic has not only changed our personal lives, but our professional lives as well.

Telocyte is no exception. Many biotech and pharmaceutical firms have had their clinical trials disrupted, their production shifted, their employees working from home, and their finances put at risk. Most companies and most employees have willingly shouldered the risk, determined to do everything possible to help others. While any company has an obligation to provide a return to those who invested their money - often their own personal pensions - in such companies, most biotech and pharmaceutical firms also have a mission to improve human health and the quality of human life. That such companies remember this latter mission speaks volumes about the compassion and dedication of those working in this industry.

At Telocyte, the impact has been largely personal, as we are still moving toward human trials, rather than being in the middle of such trials. While many of our investors and potential investors have had to delay working with us, [other investors](#) are becoming even more eager to move ahead, as the Coronavirus has made their interest in biotechnology all the more poignant and critical to them, both personally and professionally.

We continue to move ahead with our work at Telocyte, but like most of you, we find ourselves working to keep up with and address the needs of our families, our neighbors, and others who share the global risks at this time. I now lead a weekly global Zoom call on Covid-19 ([here](#) is the March 25 call), while working full time for Telocyte. All of us at Telocyte, and probably an increasing number of you who are reading this, know people who have Covid-19. These are troubling times. Not only are there personal medical risks, but our society - locally and globally - is changing around us. While we will continue to focus on curing Alzheimer's disease, we want each of you to know that we share the same concerns we all face as the world changes.

Be safe, be healthy, and please be careful
